Dynamic Priority Scheduling Real-Time Operative Systems Course

Paulo Pedreiras, DETI/UA/IT

November 9, 2021

- Preliminaries
- 2 Online scheduling with dynamic priorities
- 3 Analysis: CPU utilization bound
- 4 Analysis: CPU Load Analysis
- **(5)** Other deadline assignment criteria

Last lecture

Fixed-priority online scheduling

- Rate-Monotonic scheduling
- Deadline-Monotonic and arbitrary priorities
- Analysis:
 - The CPU utilization bound
 - Worst-Case Response-Time analysis

Agenda for today

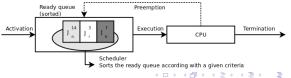

- Online scheduling with dynamic priorities
 - Earliest Deadline First scheduling
 - Analysis: CPU utilization bound and CPU Load Analysis
- Optimality and comparison with RM
 - Schedulability level, number of preemptions, jitter and response time
- Other dynamic priority criteria
 - Least Slack First, First Come First Served

- Preliminaries
- 2 Online scheduling with dynamic priorities
- 3 Analysis: CPU utilization bound
- 4 Analysis: CPU Load Analysis
- 5 Other deadline assignment criteria

Dynamic priorities

Ready Queue sorted by instantaneous priorities and dynamically re-sorted (if necessary)

- Scheduling is based in dynamic criteria, i.e. one that is known only at run-time
- The dynamic parameter used to sort the ready tasks can be understood as a dynamic priority
- The ready queue is (re)sorted according with decreasing priorities whenever there is a priority change. Executes first the task that has the greater instantaneous priority
 - Complexity O(n.log(n))

Pros

- Scales well (wrt SCS)
 - Changes made to the task set are immediately seen by the scheduler
- Accommodates easily sporadic tasks (wrt SCS)
- Allows higher utilization levels than Fixed Priorities

Cons

- More complex implementation (wrt SCS and FP)
- Higher overhead (wrt SCS and FP)
 - Re-sorting of ready queue; depends on the algorithm
- "Unpredictability" on overloads (wrt FP)
 - It is not possible to know a priory which tasks will fail deadlines

Priority allocation approaches

- Inversely proportional to the time to the deadline
 - EDF Earliest Deadline First
 - Optimal among all dynamic priority criteria
- Inversely proportional to the laxity or slack
 - LSF (LST or LLF) Least Slack First
 - Optimal among all dynamic priority criteria
- Inversely proportional to the service waiting time
 - FCFS –First Come First Served
 - Not optimal with respect to meet deadlines; extremely poor real-time performance
- etc.

- Preliminaries
- 2 Online scheduling with dynamic priorities
- 3 Analysis: CPU utilization bound
- 4 Analysis: CPU Load Analysis
- **(5)** Other deadline assignment criteria

Schedulability tests

- Since the schedule is built online it is important to determine a priori if a given task set meets or not its temporal requirements
- There are three types of schedulability tests:
 - Based on CPU utilization
 - Based on CPU load (processor demand)
 - Based on response time

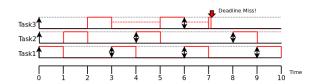

EDF Scheduling

EDF tests based on CPU utilization (n independent tasks, with full preemption)

- \bullet D = T
 - $U(n) = \sum_{i=1}^{n} (\frac{C_i}{T_i}) \le 1 \Leftrightarrow \mathsf{Task} \; \mathsf{set} \; \mathsf{is} \; \mathsf{schedulable}$
 - Allows using 100% of CPU with timeliness guarantees
- D < T
 - $U(n) = \sum_{i=1}^{n} (\frac{C_i}{D_i}) \le 1 \Rightarrow \text{Task set is schedulable}$
 - Sufficient condition, only.
 - Pessimistic test (as for RM, inflates the utilization)

RM Scheduling - example

τ	С	Т
1	1	3
2	1	4
3	2.1	6

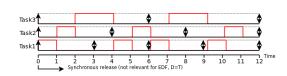

- $U = \frac{1}{3} + \frac{1}{4} + \frac{2.1}{6} = 0.93 > 0.78 \Rightarrow 1$ activation per period NOT guaranteed.
- In fact τ_3 fails a deadline!

EDF Scheduling – same example

Same example as before!

τ	C	Т
1	1	3
2	1	4
3	2.1	6

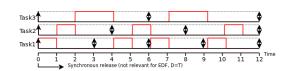

• $U = \frac{1}{3} + \frac{1}{4} + \frac{2.1}{6} = 0.93 \le 1 \Leftrightarrow$ one activation per period IS guaranteed.

EDF Scheduling – same example

Same example as before!

$\overline{\tau}$	С	Т
1	1	3
2	1	4
3	2.1	6

Note:

- No deadline misses
- Less preemptions
- Higher jitter on quicker tasks
- The worst-case response time does not coincide necessarily with the synchronous release

EDF Scheduling

Notion of fairness

- Be fair on the attribution of resources (e.g. CPU)
- EDF is intrinsically fairer than RM, in the sense that tasks see its relative deadline increased as the absolute deadline approaches, independently of its period or any other static parameter.
- Consequences:
 - Deadlines are easier to met
 - As the deadline approaches preemptions suffered by a given task are reduced
 - The slack of tasks that are quick but have large deadlines can be used by other task (higher jitter on tasks with shorter periods)

- Preliminaries
- 2 Online scheduling with dynamic priorities
- 3 Analysis: CPU utilization bound
- 4 Analysis: CPU Load Analysis
- **(5)** Other deadline assignment criteria

CPU Load Analysis

- For D < T, the biggest period during which the CPU is permanently used (i.e. without interruption, idle time) corresponds to the scenario in which all tasks are activated synchronously. This period is called synchronous busy period and has duration L
- L can be computed by the following iterative method, which returns the first instant since the synchronous activation in which the CPU completes all the submitted jobs

Computation of L

$$L(0) = \sum_i (C_i)$$
 $L(m+1) = \sum_i (\lceil \frac{L(m)}{T_i} \rceil) \cdot C_i$ Stop condition: $L(m+1) = L(m)$

CPU Load Analysis

Knowing L, we have to guarantee the Load Condition , i.e.

$$h(t) \leq t, orall t \in [0, L[\Rightarrow \textit{Task set is schedulable}]$$

- The Load Condition refers to all the work that must be completed by t.
- How to compute h(t)?
- Example:
 - Task set $\Gamma = \{(2,4), (2,8), (3,16)\}$
- Draw the Gantt chart and mark the points where tasks must complete
- Write a suitable equation

CPU Load Analysis

Knowing L we have to guarantee the load condition, i.e.

$$h(t) \leq t, \forall t \in [0, L[$$

And h(t) can be computed as follows:

$$h(t) = \sum_{i=1..N} max(0, 1 + \lfloor \frac{t - D_i}{T_i} \rfloor \cdot C_i)$$

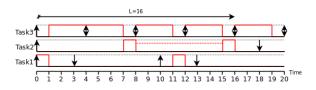

- The computation of h(t) for all values of $t \in [0, L[$ is unfeasible.
 - However it is enough computing the load condition for the instants in which the load function varies, i.e.

$$S = \bigcup_{i} (S_i), S_i = \{m \cdot T_i + D_i\}, m = 0, 1, ...$$

Note: there are other, possibly shorter, values for L

EDF Scheduling

τ	С	D	Т
1	1	3	10
2	2	18	20
3	3	4	4

- $\sum_{i=1..N} \frac{C_i}{D_i} = \frac{1}{3} + \frac{2}{18} + \frac{3}{4} = 1.194 > 1 \Rightarrow$ Schedulability not guaranteed
- But the CPU load analysis indicates that the task set is schedulable!

- Preliminaries
- 2 Online scheduling with dynamic priorities
- 3 Analysis: CPU utilization bound
- 4 Analysis: CPU Load Analysis
- **6** Other deadline assignment criteria

LSF Scheduling

Least Slack First: Executes first the task with smaller slack $(L_i(t)=d_i-c_i(t))$

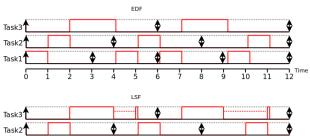

LSF vs EDF short comparison

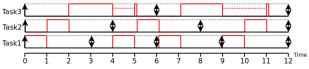

- LS is optimal (as EDF)
- As the slack ↑ the priority ↓
- Priority of ready tasks increases as time goes by
 - Rescheduling only on instants where there are activations or terminations.
- Priority of the task in the running state does not change
 - In EDF the priorities of all tasks (ready and executing) increase equally as time goes by
- Causes an higher number of preemptions than EDF (and thus higher overhead)
- No significant advantages with respect to EDF!

LSF scheduling example

LSF vs EDF

τ	С	Т
1	1	3
2	1	4
_3	2.1	6

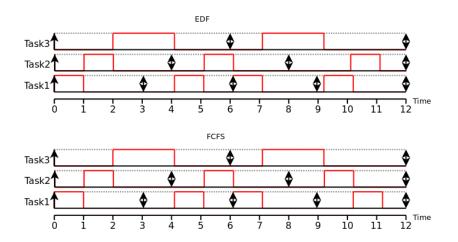

FCFS Scheduling

Execute tasks as they arrive. Priority depends on the arrival order. A brief comparison between FCFS and EDF/LLF

- Non optimal
 - May lead to deadline misses even with very low CPU utilization rates
- Job age ↑ Priority ↑
- Priority of the ready and running tasks increases as time goes by (an in EDF)
- New jobs always get the lower priority
- There are no preeemptions (smaller overhead and facilitates the implementation)
- Very poor temporal behavior!

FCFS – same example

• When the "age" is the same the tie break criteria is decisive!

Summary

- On-line scheduling with dynamic priorities
- The EDF Earliest Deadline First criteria: CPU utilization bound and CPU Load Analysis
- Optimality of EDF and comparison with RM:
 - Schedulability level, number of preemptions, jitter and response time
- Other dynamic priority criteria:
 - LLF (LST) Least Laxity (Slack) First
 - FCFS First Come First Served
